## Course-Level Assessment Project

## Continuation Final Report

To complete the Final Report, type your responses to the prompts below. Share a copy of the document with your supervisor and the Associate Provost of Assessment and Institutional Research.

Faculty Name(s): Mary Virostek
Division/Department: Mathematics and Engineering
Course Assessed: MAT 099 Foundations for College Mathematics, Part 2

## Step 1. Define

Explain the purpose or rationale for assessing the selected course.
Identify which course objective(s) were assessed. Briefly explain why you selected these course objectives for assessment.
Identify to which program goal(s) selected course objective(s) align.

Though this course is intended to prepare students for MATH 130 Precalculus, many students take this course as a prerequisite for other courses including Chemistry, Physics, and Finance or MATH 122 Math Concepts and Structures if pursuing a degree in Education. Though this course does not count towards graduation credit or towards most students GPA, passing the course is a requirement for many majors and for acceptance to some fouryear institutions in Maryland. This course was first chosen to participate in a Course-Level Assessment due to the number of students enrolled and sections offered each semester. Over the last five years, the number of students enrolled, and sections offered has decreased significantly due to other pathways created in that range of time for many Associate degrees. However, over the past few years, a completely online course for MAT 099 has also been created and pass rates have slowly but steadily improved. This past academic year, there were no remote synchronous classes, two online classes, and four in person classes for MAT 099.

There continued to be five objectives assessed out of the twelve objectives listed for this course.

- Being able to use symbols to display mathematical meaning was assessed through using proper interval notation when solving inequalities.
- Evaluation a function occurred frequently throughout the course and was presented in similar but ever evolving ways as students first substituted numerals for variables then eventually progressing to substituting polynomials and even other functions in for variables.
- By assessing an application of solving systems of equations, not only were we able to see misconceptions in understanding the solution is where two linear equations intersect, we were also able to assess translating English sentences to mathematical equations.
- Mixture problems synthesize understanding the concept of systems of equations with a tangible example of the application of this type of mathematics. Students must understand the underlining problem along with the mathematics to solve this type of problem successfully.
- What does the quadratic formula tell us about a particular quadratic equation? Quite a bit! As gravity acts on an object, the object changes trajectory. How long will it take an object to reach its maximum height before gravity brings the object plummeting to the earth once more? What was the maximum height the object reached? When will the object be so many feet above the ground? When will the object fall to the ground? All slightly different questions that can be answered in a variety of ways. Which way is the best approach? Does the answer make sense? Students learn to think as well as compute solving application problems in quadratic form.

Since MAT 099 is not a General Education course, it does not have any program goals.

## Step 2. Design

Describe the instrument (project/assignment) used to assess identified course objective(s).
What benchmarks and/or controls were established?
Explain how the assessment instrument was externally reviewed and validated.

Five common questions were distributed to all MAT 099 sections during the semester and these same five questions were on everyone's final exam though the questions were not identical to the previously administered tests. Four of the common questions were on the Unit 1 Test and one question worth $15 \%$ of the test score was on the Unit 3 test. For the final exam, all five questions were worth the same amount of the overall grade for a total of $12.5 \%$ of the final exam.

For consistency purposes, a detailed grading rubric was included with each of the five types of questions. For Fall 2022 and Spring 2023, professors were asked to document how many points were earned for each of the five questions during the semester and on the final exam.

Professors were given the common questions through Teams for the unit tests before the semester started and feedback was encouraged.

## Step 3. Implement

Explain how the assessment was implemented.
Did any unexpected challenges arise in implementing the assessment?

Implementation: The common questions and feedback table were stored in Teams for everyone to access when needed instead of finding them in their emails. Reminders were sent out to use the questions on the Unit 1 and Unit 3 test as well as to collect the data. Since I made up the final for everyone, I did not have to share the common questions for the final in Teams. A detailed rubric was attached to the questions as well and a reminder was sent to collect the data in the End of Semester Checklist.

Course Level Assessment Project Report 092020

Data was collected using the Hawkes Learning System's Report to find the average time it took the students that completed a Certify for each objective.

|  | Done on time | Completed late | Did not Certify but attempted | Average <br> Time spent on Learn | Average Time Spent on Practice | Average Time Spent on Certify | Average <br> Time on all three | Standard Deviation of time spent on all three | Number of people that took more than one attempt to certify |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Average Time Per Class on Sections corresponding to the Outcomes collected Spring 2023
Though there were only two classes of MAT 099 that had enough students to run this past spring semester, I decided to gather the data the same way I had for the fall. The first row are the results for MAT 099-02 (TTH) and the second row are the results for MAT 099-75. I taught both classes.

Section7.8

Step 4. Analyze
Explain the data that was collected and how the data was analyzed.
To what degree did students meet the established benchmarks?
Consider intention of learning activity and assessment as compared to results.
Summarize the results of implementing changes, re-administering the assessment, and collecting and analyzing new data.
The first tables show the average time it took students to complete homework sections that pertained to the target objectives through Hawkes Learning System for MAT 099 classes taught from Spring 2021 through Spring 2023 when I was able to obtain the data before archiving the information. Hawkes Learning System provides this data though I had to learn how to find and use the information they collect. Part of the reason the pass rate increased for MAT 099-75 starting Fall 2022 had to do with "nudging" students through Canvas to do the Learn portion of the Hawkes Learning System and inquiring from the students which lessons could use more videos created by me and on what specific subject. Students were more than willing to inform me where they could have used more explanations. Since the online students are not in class to see examples, it is imperative that they watch the videos I made as well as the example videos provided by Hawkes Learning System. Students spent minimal time watching the examples in Spring 2021 but spent two to three times longer in subsequent semesters. The pass rate increased, though it was still below the average for the class. This pass rate did not change significantly for Fall 2022 or Spring 2023 but remained higher than the first year we offered the online option.

Those students taking the course in person did not need to work through the Learn portion of Hawkes Learning System. Practice of the concepts was also done in class for every section but the online section unless a student was absent. Those that chose to practice improved their overall grade in the course.

The second set of tables gathered the outcome assessments for the course over four semesters. Each table shows the average score students made on the five focus objectives, their overall Hawkes Learning System grades, their final exam score, and their overall scores for the course. Though these figures are significant, the student body's background knowledge change each semester; thus, it is difficult to formulate a one-to-one correspondence in the changes that were implemented and the outcomes on the test questions. Nonetheless, I do notice that students understand mixture problems using

Course Level Assessment Project Report 092020
systems of equations on the first test then their score goes down dramatically for the same objective on the final exam semester after semester whereas the other concepts do not vary as significantly. This indicates that the final exam review needs to highlight this concept more directly as this concept should be mastered to use in both MATH 122 Math Concepts and Structures and MATH 130 Precalculus.

Insight gained from this project

I understood better the time expectations of students to complete each Certify. An unexpected positive from collecting this information was learning how to obtain this information from Hawkes Learning System and use it to identify any section that most students are taking more than the average expected amount of time to complete ( 60 minutes) and to alter the homework and/or guided notes for each of those sections. What I learned from this project I then shared with Kristin Hadden. Consequently, we made modifications to the Certify homework in Hawkes Learning System for all transitional courses (MAT 091, MAT 095, and MAT 099) after the Spring 2023 semester.

Step 5. Modify/Maintain
Based on analysis of data, describe changes made to the course and/or course materials.

This Course Level Assessment Project encouraged me to look for a way to do what we already do but better. Test corrections are a highly researched and documented Best Practice in teaching. By changing when students do the test corrections benefitted the online students when taking the test. When MAT 099-75 started, we did test corrections after the test as we do with in person classes. That feedback, though beneficial, is not as timely as I would like. Also, less than $20 \%$ of our students do not complete the Hawkes Learning System Certify review before a test since this review consists of more problems than the section certifies and amounts to only $2.5 \%$ of their overall homework grade or $0.2 \%$ of their overall course grade. There are five of these reviews throughout the course. I know the benefits of reviewing for a test but $1 \%$ of the total number of points for this class is not significant for students to dedicate their limited time to completing. When the online class started doing a WebTest Review in Hawkes Learning System before taking a test, those that did this review were able to ask questions before taking the test which increased their overall score on a test. If they did the WebTest Review after taking the test, then they either learned the benefit of completing this activity before taking the test or were practicing after taking a test which also has its own benefits. Also, with HLS Certifies, students cannot skip questions but must complete the randomized questions in order but once they reach the proficiency goal of $80 \%$, they do not have to continue. This means about $20 \%$ of the questions or concepts that may show up on a test are not reviewed before a test. In contrast, a WebTest is worth $1.7 \%$ of their total score or $8.5 \%$ overall. In a WebTest, students can skip and do all the problems they understand first, then use their notes to help them with problems they struggle with. After they complete the whole test, they can use the Open Tutor tab in Hawkes Learning System to make the appropriate corrections to their work and then they submit their original work, the corrections, and help around any problem they still do not understand. Their professor can then give them feedback based on their attempt and students can ask for help. Not only did the online students learn from their mistakes before taking a test, but I was also not grading their other test twice. Interestingly, more students did the test corrections in the WebTest review format than they did resubmitting their test again in Canvas.

Based on what I learned, all MAT 099 students will be doing the WebTest Review and Corrections from the WebTest Review for each unit and the final exam instead of the HLS review Certifies and will be making corrections on these WebTest Reviews rather than making corrections after they take their test. Students will still be encouraged to make corrections and seek help after taking a Unit Test, but this will no longer be part of their grade.
Course Level Assessment Project Report 092020

Here is a compilation of the changes made to MAT 099 over the two years of this Course Level Assessment Project

Changes made after Fall 2021 were towards instruction. Knowing the type of mistakes and the misconceptions students had coming into our classroom assisted the professors in delivering material in a more meaningful way during the 2022 spring semester. More practice problems were embedded into the guided notes to give students a chance to try and ask more meaningful questions.

For the Spring 2022 MAT 099-75 course, instead of the Book Activities due the class before a test, each activity was dispersed throughout the semester. Not only did this keep students on schedule, this shorter yet more frequent activity allowed me as the professor to give them feedback earlier in a unit and kept students more accountable.

For all transitional courses, Kristin Hadden and I implemented using the Final Exam grade to replace a lower scoring unit test grade if this substitution helped, not hindered the students' overall score. By using this in MAT 099, two students out of sixty-four in Spring 2022 went from not scoring high enough to pass to enough to take the MAT 001 self-paced completer course and two went from below a $75 \%$ to above a $75 \%$. To pass this course, a student must have a score of $75 \%$ (unrounded) or better. From collecting and studying the data, we noticed that some students had one low test grade but showed they knew the material on the final exam. This gave students motivation to continue taking the course even with one below passing unit grade. This "reason to continue" helped many students that were going through a rough time somewhere in the semester. For example, even though the overall grade only went up by one to three percentages, twenty-eight out of sixty-four or almost $44 \%$ of the students that did not withdraw from MAT 099 benefitted from using the final exam to replace a low scoring unit test. Two students even went from a B+ to an A.
This past Spring 2023 semester, I had a student that missed a whole unit's worth of material because the student's family was moving. This student earned a low F on that unit test though normally that student earned A's on tests. By reminding the student of the replacement policy, the student finished the course, learned the material from the missed unit, and earned a B on the final and a B+ in the course.

To the best of my ability, I reworked some sections of the MAT 099-75 course to promote completing activities before taking the unit tests. For example, in the face-to-face MAT 099 courses we have a review day planned in the schedule at the end of each unit. During the review day, professors can finish the unit, go over specific objectives, and allow students to ask questions or complete review materials. This opportunity was not in the schedule for the asynchronous class resulting in students not obtaining necessary feedback before taking the unit test. Though the test was available for three days in the testing center, many students did the review for the test after taking the unit test since the review was due in the middle of those three days. Including this review day prior to a test gave students a chance to catch up if they were falling behind and an opportunity to review before taking the Unit Test. More students that completed the online class (took the final), passed the course in Spring 2023.

Summer 2022, I made videos addressing specific objectives and placed these videos in all MAT 099 courses regardless of format.

With the goal of encouraging online students to read the material before the due date, I set up the Canvas course Spring 2023 so that the read and learn part was in their calendar a day before the activity corresponding to the videos and information was due. Maybe it was the students I had in the online

Course Level Assessment Project Report 092020
class this past Spring, but more students completed their assignments on time or soon thereafter. This practice will be implemented in subsequent semesters.

## Final Results and Recommendations

After collecting the data and multiple meetings, Brianna McGinnis, Kristin Hadden, and I have determined that MAT 001, the course created to help those students that earned between a $70 \%$ and a $75 \%$ in transitional math, will be discontinued as of Summer 2023. Instead, students will not longer be required to earn a $75 \%$ or higher to pass MAT 099. The threshold will now be $70 \%$ and those that earn a C for any transitional course will be asked to sign up for tutoring for a minimum of the first four weeks of their next math course.

Since the review using the WebTest was so successful in the online MAT 099 course, the plan for Fall 2023 on is to remove the Hawkes Learning System Certify review and implement completing a WebTest review before a Unit Test for all MAT 099 courses, regardless of modality. Students will make test corrections on their first attempt at the WebTest and will be allowed to retake the WebTest up to three time to study with the highest WebTest score counting as their grade. I have included below the directions in Canvas and a rubric that will be used to encourage students to complete their first attempt before taking the actual test.

Taking the WebTest is only part of the grade for this activity. You may take the WebTest more than once and the highest grade will count. However, learning takes place when you understand your mistakes. Test corrections are an important study skill and best practice in the teaching field; therefore, your test corrections completed before you take the actual test count as half of the points for this activity. You may pause WebTests but try to finish all at one time, if possible.

To complete your test corrections:

- Start by reviewing your first attempt of the WebTest
- For questions that were incorrect or not answered, explain what your mistake was in words and use the open tutor button to re-do the problem correctly showing each step.
- You can complete the test corrections using your notes, HLS Open Tutor, and/or with a Carroll Community College tutor. You may also ask your professor for help with a particular problem.
- Submit this work in Canvas after your first attempt at the WebTest. If you take the WebTest multiple times, only the best grade counts towards your HLS homework grade.
- If you earned an A on the WebTest, explain in a couple of sentences which concept in this unit caused you the most trouble and how you successfully learn this material.

Remember, there are multiple ways to solve every problem. Show how you are attempting the problem so that the subsequent feedback follows your preferred method. Leaving a problem completely blank will not assist your professor in helping you.

## Review WebTest and Test Corrections Rubric

Review WebTest and Test Corrections Rubric

| Criteria | Ratings |  |  |  | Pts |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Turned in the Test Corrections in Canvas by the due date. | $\begin{aligned} & \text { 4 to }>3.0 \mathrm{pts} \\ & \text { Full Marks } \end{aligned}$ |  | $\begin{aligned} & 3 \text { to }>0 \text { pts } \\ & \text { No Marks } \end{aligned}$ |  | 4 pts |
| Made appropriate corrections to all incorrect responses and explained in words why points were deducted. If the student earned an A on the test, the student answered the questions associated with their grade. | $\begin{aligned} & 6 \text { to }>1.0 \text { pts } \\ & \text { Full Marks } \end{aligned}$ |  | $\begin{aligned} & 1 \text { to }>0 \text { pts } \\ & \text { No Marks } \end{aligned}$ |  | 6 pts |
| Score on WebTest <br> Proportional grade based on highest WebTest grade. | $\begin{aligned} & \mathbf{1 0} \text { to } \mathbf{> 9 . 9} \mathbf{~ p t s} \\ & \text { Full Marks } \\ & 100 \% \text { on } \\ & \text { WebTest } \end{aligned}$ | 9.9 to $>0.5 \mathrm{pts}$ <br> Partial Credit <br> Proportional gr WebTest grade | de based on | $\begin{aligned} & 0.5 \text { to } \\ & >0 \text { pts } \\ & \text { No Marks } \end{aligned}$ | 10 pts |

Total Points: 20
